Mail Stop PATENT APPLICATION
Commissioner for Patents
P. O. Box 1450
Alexandria, Virginia 22313-1450

Sir:

We enclose two Certified Copies of Great Britain applications Nos. 0317015.6
and 0302295.1, priority of which has been claimed in the subject application.

Respectfully submitted,

Date: Oct. 15, 2003

Alan Ruderman
Reg. No. 25,369
Telephone: (423) 756-6600

Enclosures: Certified Copies of two Great Britain applications

CERTIFICATE OF MAILING

I hereby certify that this correspondence is being deposited with the United States Postal Service as first class mail in an envelope with sufficient first-class postage addressed to:

Mail Stop PATENT APPLICATION
Commissioner for Patents
P. O. Box 1450
Alexandria, Virginia 22313-1450

on this 15th day of October, 2003.

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 01645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

A TUFTING MACHINE NEEDLE

The present invention relates to a needle for a tufting machine.

5

A plurality of needles are provided across the width of the tufting machine. Each needle is threaded with an individual yarn when it is spaced from the backing cloth. In operation the point of the needle first penetrates the backing cloth and continuing movement of the needle pulls the yarn through the backing cloth. On the underside of the backing cloth, the yarn is picked up by a hook or looper which holds the loop of yarn while the needle is retracted back through the backing cloth.

10
15

The tufting needle was originally developed from a sewing machine needle. In all solid, non-hollow tufting needles, a yarn protection groove is provided running along the shank of the needle to protect the yarn during the needle penetration into the backing material. A hook lead-in chamfer is generally provided to facilitate the pick up of the yarn by the hook from the needle.

20
25

According to the present invention there is provided a solid, non-hollow tufting machine needle with a hook lead-in chamfer and without a yarn protection groove.

30

The inventor has found that, contrary to conventional wisdom, the yarn protection groove is not necessary in a tufting needle and eliminating it can even provide certain advantages.

35

With a yarn protection groove, the yarn crosses the wall of the yarn protection groove in an angular

direction at the point of needle penetration into the backing cloth. Thus results in yarn being trapped between the needle wall and the backing cloth, and also rolls or twists the yarn during the stroke of the
5 needle. This interruption of the yarn flow often creates unevenness on the carpet surface, especially of loop pile fabrics.

10 Once the yarn has passed through the backing cloth, the yarn protection groove is unnecessary as there is no yarn restriction and adequate clearance.

15 Thus, in effect, it has been found that the yarn protection groove provides little or no benefit.

By eliminating the yarn protection groove, the needle is stronger and considerably less expensive to manufacture as it does not need to have a complex structure with varying sections of thickness. The
20 manufacturing process can be simplified as multiple die pressing operations and can be reduced or even eliminated.

The invention also opens up the possibility of
25 producing needles from a flat plate, suitable for moulding in a needle module, or a round bar with a machined or a flat pressed working area for single needles which are inserted into round holes drilled in a needle bar.

30 Also, due to the simplicity of the design, the needles can be produced using conventional machine tools, including wire erosion (EDM) instead of the special purpose machines necessary with the
35 conventional design. The needle can also be moulded in tungsten, powder steel metallurgy and tough nylons.

The additional strength gained by eliminating the groove has resulted in smaller section needles. This, amongst other things, reduces the size of the needle penetration hole in the backing cloth which has significant advantages in tuft retention and backing cloth strength. This is particularly important when tufting into non-woven backing cloths, especially in the automotive industry where backing cloth strength is vital during the moulding operation of carpets.

As the yarn protection groove has been eliminated, the lead-in chamfer can be made wider and more gradual, as compared to a conventional needle thereby improving the hook or looper pick-up.

In order to compensate for the elimination of the yarn protection groove, a chamfer may be provided on the yarn inlet sides of the needle, although this is not believed to be necessary. Alternatively, with a flat plate configuration, the needle can be angled such that the plane of the flat plate is angled with respect to the direction in which, in use, the backing passes through the tufting machine.

In order to smooth the passage of the yarn through the eye, chamfers are preferably provided on the inlet and outlet to the eye.

The invention also extends to a needle module having a plurality of needles according to the invention.

The present invention also extends to a tufting machine having a plurality of needles arranged across the machine, each being arranged to be threaded with an individual yarn when the needle is spaced from a backing material which, in use, is fed through the

machine in a direction transverse to the direction in which the needles are arranged, wherein each needle is arranged to penetrate the backing material thereby pulling its yarn through the backing material, and a
5 respective hook or looper is arranged to pick up the loop of yarn from each needle and to hold the loop as the needle is retracted; wherein each needle is a solid, non-hollow needle without a yarn protection groove.

10

Examples of a standard tufting needle and a tufting needle in accordance with the present invention will now be described with reference to the accompanying drawings, in which:

15

Fig. 1A is a cross-section through a conventional needle;

20

Fig. 1B is a plan view of a conventional needle;

Fig. 1C is a cross-section through line C-C in Fig. 1B;

25

Fig. 1D is a cross-section through line D-D in Fig. 1B;

Fig. 2 is a schematic showing a conventional needle in use in a tufting machine;

30

Fig. 2A is a cross-section through line A-A in Fig. 2.

Fig. 3 is a view similar to Fig. 2 showing a first example of the present invention;

35

Fig. 3A is a cross-section through line A-A in Fig. 3;

Fig. 4 is a schematic plan view of a needle in accordance with the second example of the present invention;

5 Fig. 4A is a cross-section through line A-A in Fig. 4;

Fig. 5A is a schematic plan view of a needle in accordance with the third example of the present
10 invention;

Fig. 5B is a side view of the needle of Fig. 5A;
and

15 Fig. 5C is a cross-section through a tip of a needle.

The conventional needle will first be described with reference to Figs. 1 and 2. The needle has an
20 elongate shank 1 at one end of which is an eye 2, and the other end 3 of which is mounted in a needle bar or needle module. A yarn protection groove 4 extends along the shank from a position adjacent to the mounted end 3 and into the eye 2. A hook lead in
25 chamfer 5 is provided on the opposite side of the needle to the yarn protection groove 4. The lead-in chamfer 5 extends only along the portion of the needle adjacent to the eye 2. It can be seen, particularly from Fig. 1A that the needle has a wide variation of
30 cross-sections along its length.

The operation of the needle is shown in Fig. 2. The needle is shown mounted in a yarn module 6 in a tufting machine. A number of such needles are
35 arranged perpendicular to the plane of Fig. 2. Backing cloth 7 supported on a series of support fingers 8 is then fed through a tufting machine from

right to left in Fig. 2. A yarn 9 which is threaded through the eye 2 of the needle is reciprocated as the needle reciprocates. The yarn is picked up on each stroke by a reciprocating hook 10 to form a series of loops as is well known in the art.

Initially, the tip of the needle penetrates the backing cloth 7 whereupon the rest of the needle successively follows it through the backing cloth 7. When the needle has penetrated to a sufficient depth (i.e. once the eye 2 has passed through the backing cloth 7), the yarn 9 starts to become trapped between the needle and the backing cloth. The yarn protection groove 4 is designed to prevent this. However, in practice, the only point at which the yarn becomes trapped is at the point where the needle passes through the backing cloth 7. At this point, the yarn 9 passes around a wall 11 of the yarn protection groove, and this tends to roll or twist the yarn during the stroke. Thus, the yarn protection groove does not fulfil its intended function satisfactorily.

The first example of the present invention will now be described with reference to Fig. 3. This figure is similar to Fig. 2, and common elements have been designated by common reference numerals. The only difference between Figs. 2 and 3, is the configuration of the needle, and, in particular, the absence of the yarn protection groove. From the cross-section of the needle shown in Fig. 3A, it is apparent that the needle is made from a flat plate. It will also be seen that this flat plate is inclined with respect to the direction in which the backing cloth passes through the tufting machine.

It will be apparent from the comparison of Figs. 1, 2 and 3 that the needle of the present invention

has a far more uniform cross-section than a conventional needle. It should be noted that the yarn 9 passes around the edge of the needle in a similar way to the way in which it passes around the wall 11 of the yarn protection groove 4. In this sense, the invention is believed to be comparable with a convention needle.

A hook lead-in chamfer 12 is provided on the needle. Owing to the absence of the yarn protection groove, this chamfer can be made larger than the conventional needle.

A second example of a needle in accordance with the present invention is shown in Fig. 4 and 4A. In this case, the needle is also of flat plate construction and has a hook lead-in chamfer 12. However, the flat plate is arranged generally parallel to the direction in which the backing cloth is fed through the tufting machine. However, equally, in Fig. 4A, the chamfer 12 could be provided on the lower right hand surface of the yarn if the hook approaches from the same direction as in Fig. 3A.

A third example of a needle in accordance with the present invention is shown in Figs. 5A-C. The needle has a hook lead-in chamfer 12 as in the previous example. In this case, the only difference is the presence of chamfer 14 on the inlet side of the eye 2 and a chamfer 15 on the outlet side of the eye 2. As will be appreciated from Fig. 5C, this provides a smoother path for the yarn through the eye 2.

CLAIMS

1. A solid, non-hollow tufting machine needle with a
hook lead-in chamfer and without a yarn protection
5 groove.

2. A needle according to claim 1 made from a flat
plate.

10 3. A needle according to claim 1 made from a round
bar.

4. A needle according to claim 1 wherein the hook
lead-in chamfer has an entrance which is the width of
15 at least a quarter of the width of the needle shank.

5. A needle according to any one of the preceding
claims with an eye, wherein chamfers are provided on
the inlet and outlet to the eye.

20 6. A needle module having a plurality of needles
according to any one of the preceding claims.

7. A tufting machine having a plurality of needles
25 arranged across the machine, each being arranged to be
threaded with an individual yarn when the needle is
spaced from a backing material which, in use, is fed
through the machine in a direction transverse to the
direction in which the needles are arranged, wherein
30 each needle is arranged to penetrate the backing
material thereby pulling its yarn through the backing
material, and a respective hook or looper is arranged
to pick up the loop of yarn from each needle and to
hold the loop as the needle is retracted; wherein each
35 needle is a solid, non-hollow needle without a yarn
protection groove.
